The news introduced by release 05/2022 of Milestone Plugin are described below.

Description

The window for entering the connection parameters when you create a new Security Panel, contains the following additional information compared to the previous release:

1. New **“Enable ‘Real Time’ Processing”** option (default ON):
if enabled, it allows you to view the status changes of all the zones in real time, even if the system is disarmed.
In the presence of large systems that manage several zones, we recommend to disable the new option to improve system performances; in that way you can prevent the arrival of frequent status changes from disarmed zones and display only the actual alarms.
Obviously, the alarms generated by 24h zones continue to be managed even if the system is disarmed.
2. **Peripherals** number (next to the Tab title):
after clicking “Download/Update Panel Configuration” button, the number of peripherals present in the configuration will be displayed.
3. **IP Zone Triggers** number (next to the Tab title):
after clicking “Download/Update Panel Configuration” button, the number of IP Zones present in the configuration will be displayed.

4.0 "Iares 4.0" family Security Panel

New Security Panel

General Peripherals (103) **IP Zone Triggers (137)**

IP Address: 192.168.55.221
